

Lab Grading Criteria

LAB 0

- Only pass/fail

LAB 1

Grade	Criteria
3	• Use both given 2 datasets (1K records and 25K records) • Implement a ANN model and a transformer model • Upload the code to GitHub
4	• Use a larger public dataset (around 1GB in capacity) –OR– • Use multiple transformer models
5	• Use a larger public dataset (around 1GB in capacity) –AND– • Use multiple transformer models • Use GPUs • Use Tensorboard/wandb (or similar for visualization) → Goal is to optimize the model.

LAB 2

Grade	Criteria
3	• Implement vanilla GAN • Implement cGAN • Implement an alternative Loss function • Send in the github link for the code of the Project. • Upload the code to GitHub
4	• Achieved all points for grade 3. • Did the adversarial attack on GAN. • Ran the diffusion model • Use GPUs
5	• Achieved all Points for grade 4. • Explains correctly how the diffusion model works.

LAB 3

- Pass & Fail.
- Must use GPUs
- Upload the code to GitHub
- In case of a tie situation of the grading (after lab 1 and 2), if beam search is implemented correctly, we will go for the higher grade.

General Criteria

As a general criteria, the networks should be converged and acceptably trained.

Training Graphs

Without LR Drop

LR Drop after convergence
